OpenGL's basic operation is to accept primitives such as points, lines and polygons, and convert them into pixels. This is done by a graphics pipeline known as the OpenGL state machine. Most OpenGL commands either issue primitives to the graphics pipeline, or configure how the pipeline processes these primitives.

OpenGL (Open Graphics Library) is the computer industry's standard application program interface (API) for defining 2-D and 3-D graphic images. Prior to OpenGL, any company developing a graphical application typically had to rewrite the graphics part of it for each operating system platform and had to be cognizant of the graphics hardware as well. With OpenGL, an application can create the same effects in any operating system using any OpenGL-adhering graphics adapter.

The main aim of the Traffic Signal Computer Graphics Mini Project is to illustrate the concepts and usage of pre-built functions in OpenGL.

Simulation of a traffic signal is being done using computer graphics. The car built using cubes can be moved using arrow keys and based on traffic signal light the user can obey the traffic rules.
