Excerpt from Cotton Its Uses, Varieties, Fibre Structure, Cultivation, and Preparation for the Market and as an Article of Commerce, Also the Manufacture of Cotton Seed Oil, Cotton Seed Meal and Fertilizers: With Especial Reference to Cotton Growing, Ginning, and Oil Pressing in the United States Considering that cotton is the greatest of all fibre crops and the most widely manufactured of all textiles, the attention which has been given in textile literature to the botany of the plant, to the structure of the fibre, and to the numerous processes through which it passes before its arrival at the mill, has been meagre in the extreme and especially small in proportion to the attention that has been given to descriptions of the after processes of manufacture. Among the many subjects of great importance to all engaged in, or associated with, cotton manu facture, which have hitherto not been made the subject of special study from a manufacturer's point of view, except in very few instances, are the growth and cultivation of the cot ton plant, plowing, sowing, cultivating, and harvesting of the crop, the ginning, baling, and compressing of the fibre, and the Shipping and handling of the bales in the markets of the world; also the manufacture of the many bye products of the cotton seed, such as cotton seed oil, meal, linters, etc., and perhaps the most important of all, a description of the varieties of cotton from all parts of the world, and the char acteristics of each cotton, its suitability for various purposes, the yarns and cloths that can be made from it, and the econ omy that can be attained by an accurate and skilled selection of cotton for each kind of yarn or goods. Usually these have been passed over by a few sentences in textile text books, Or altogether ignored, but in this volume they are now dealt with very fully. Excerpt from Cotton Cultivation in Africa: Suggestions on the Importance of the Cultivation of Cotton The suggestions on the importance of cotton in Africa, as a measure calculated to effect the abolition of slavery in America, were presented originally to those more immediately interested in the success of the proposed measure. The practicability of the scheme was then supposed to have been clearly demonstrated. But that which a few years since might have been considered rather speculative, and, perhaps, by some even visionary, with the information then obtained, is now placed beyond all doubt; and the fact is established to the entire satisfaction of those who have labored so zealously for the accomplishment of the object -that cotton of superior quality, fully equal to the best grown ill America, can be raised in Africa by free labor, in an unlimited quantity, and much cheaper than it can be produced by the expensive slave labor of the United States. In confirmation of this, we have the testimony of, the celebrated African travellers, Barth, Livingstone, and Bowen, whose explorations have revealed the fact that nearly the whole continent of Africa is admirably adapted to the cultivation of cotton. That in many places it grows spontaneously, and that several kinds bloom all through the year, requiring only the labor of picking.
