Stabilizers for plastics introduced into the Japanese market since 1974 are surveyed. The results suggest that major developments have occurred in the field of hindered phenols and hindered amines, followed by phosphorus antioxidants and UV absorbers. Effects of molecular weight of stabilizers on performance as well as possible applications of high molecular weight stabilizers are discussed, as there seems to exist a tendency towards increase in molecular weight of stabilizers.

A complementary and ultimately more
important objective is to
accommodate these practical
developments within the framework of
antioxidant theory, since there can be
little question that further major
advances in the practice of
stabilisation technology will only be
possible on the basis of a firm
mechanistic foundation.
