This paper offers an introduction to game theory for applied economists. I try to give simple definitions and intuitive examples of the basic kinds of games and their solution

concepts. There are four kinds of games: static or dynamic, and complete or incomplete

information. (Complete information means there is no private information.) The

corresponding solution concepts are: Nash equilibrium in static games of complete information; backwards induction (or subgame-

perfect Nash equilibrium) in dynamic games of complete information; Bayesian Nash equilibrium in static games with incomplete information; and perfect Bayesian (or sequential) equilibrium in dynamic games with incomplete information. The main theme of the paper is that these solution concepts are

closely linked. As we consider progressively richer games, we progressively strengthen the solution concept, to rule out implausible equilibria in the richer games that would survive if we applied solution concepts available for simpler games. In each case, the stronger solution concept differs from the

Case studies help underscore the usefulness of game theory for analyzing real-world situations. Each chapter concludes with a review and questions
