Heterocyclic Chemistry

A heterocyclic compound or ring structure is a cyclic compound that has atoms of at least two different elements as members of its ring(s).

Heterocyclic chemistry is the branch of organic chemistry dealing with the synthesis, properties, and applications of these heterocycles..

Examples of heterocyclic compounds include all of the nucleic acids, the majority of drugs, most biomass (cellulose ...

Heterocyclic compound - Wikipedia

Some examples are:

- The terminal "e" in the suffix is optional though recommended.
- Saturated 3, 4 & 5-membered nitrogen heterocycles should use respectively the traditional "iridine", "etidine" &...
- Unsaturated nitrogen 3-membered heterocycles may use the traditional "irine" suffix.
