IBM MQ is a robust, reliable, and secure messaging solution. It simplifies and accelerates the integration of different applications across multiple platforms, and it supports a wide range of APIs and languages. IBM MQ enables applications to communicate and exchange data in a reliable and scalable way, that decouples one application from another. In this way, MQ assists the integration of applications running in different frameworks, languages, platforms, clouds and locations.

IBM was founded in 1911 in Endicott, New York, as the Computing-Tabulating-Recording Company (CTR) and was renamed "International Business Machines" in 1924. IBM is incorporated in New York and has operations in over 170 countries. In the 1880s technologies emerged that would ultimately form the core of International Business Machines (IBM).

IBM - Wikipedia

A poison message is a message which is unable to be processed by a receiving application. The following are some possible reasons for this... The IBM MQ client code itself fails to handle the message due to e.g. a bad header in the message. The message causes an error in the underlying system e.g. in the XML parser.

Understanding MQ Backout Queues & Thresholds

(1) MQTT is an ideal protocol for developing IoT applications or in cases where bandwidth is constrained and small message overheads are desirable. IBM MQ supports the MQTT 3.1.1 protocol. Eclipse Paho clients can be used to connect to IBM MQ. (2) Messaging REST APIs can be used to interact with queues and, as of version 9.1.5, for publishing ...
