Equilibrium of a rigid body-conditions and physics. A rigid body is said to be in mechanical equilibrium, if both its linear momentum and angular momentum are not changing with time. In other words, the body is in mechanical equilibrium when it has neither linear acceleration nor angular acceleration.

Equilibrium of Rigid Bodies A rigid body is said to be in equilibrium if; the vector sum of the forces acting is zero (the sum of the components in any direction is zero) the algebraic sum of the moments of the force about a particular point is zero.

## *Statics of Rigid Bodies - Teachnet UK*

- The condition for a rigid body to be in static equilibrium is that there is no net force and no net torque.
- An important branch of engineering called statics analyzes buildings, dams, bridges, and other structures in total static equilibrium.
