The "median" is the "middle" value in the list of numbers. To find the median, your numbers have to be listed in numerical order from smallest to largest, so you may have to rewrite your list before you can find the median. The "mode" is the value that occurs most often. If no number in the list is repeated, then there is no mode for the list.

The Mode . In statistics, the mode in a list of numbers refers to the integers that occur most frequently. Unlike the median and mean, the mode is about the frequency of occurrence. There can be more than one mode or no mode at all; it all depends on the data set itself. For example, let's say you have the following list of numbers:

Mode refers to the number in a list that occurs most often. For example, in the group 12, 12, 16, 16, 16, 25 and 36, the number 16 is the mode. Putting It All Together If you have the numbers 125, 65, 40, 210 and 65, the average would be 101, or the total of all five numbers (505) divided by the number of data points (five).

Definition of Mean, Median & Mode | Sciencing
Estimated Mean = Sum of (Midpoint × Frequency)Sum of Frequency. To estimate the Median use: Estimated Median = L + (n/2) − BG × w. where: L is the lower class boundary of the group containing the median ; n is the total number of data ; B is the cumulative frequency of the groups before the median group ; G is the frequency of the median group

Mean, Median and Mode Introduction Measures of central tendency, or averages, are used in a variety of contexts and form the basis of statistics. Mean (Arithmetic Mean) To

calculate the arithmetic mean of a set of data we must first add up (sum) all of the data values (x) and then divide the result by the number of values (n). Since

When the data sample contains an even number of values, the median is the mean of the two middle values. While this can be confusing, simply remember that even though the median sometimes involves the computation of a mean, when this case arises, it will involve only the two middle values, while a mean involves all the values in the data sample.

The mean, median and mode of a data set are collectively known as measures of central tendency as these three measures focus on where the data is centred or clustered. To analyse data using the mean, median and mode, we need to use the most appropriate measure of central tendency.

As you probably know the terms average, mean, median, and mode are commonly confused with one another because they all describe ways to talk about sets of numbers. To look at how each term works, let's say that nine students took a quiz, and the scores were 91, 84, 56, 90, 70, 65, 90, 92, and 30. What is the mean?

Mean, median and mode are all measures of central tendency in statistics. In different ways they each tell us what value in a data set is typical or representative of the data set. The mean is the same as the average value of a data set and is found using a calculation. Add up all of the numbers and divide by the number of numbers in the data set.
